

Special designs

In addition to the standard designs shown in this catalogue, we can offer the Seguro gate valves in a number of different layouts to suit your needs.

- **Bypass**
All the valves in standard A, B and TO over DN 16" /DN 400mm can be delivered with bypass mounted either on the side or in the bottom of the valve. The German short style valve (TF) does not leave room for bypass in all sizes.
- **Support wheels**
From DN18" and up, the gate can be supplied with a set of wheels to support the gate and reduce wear, resistance and torque.
- **Chain wheel**
When valves are placed high above the floor, a chain wheel drive is an alternative to the more expensive electrical actuators. Please tell us how long the chain should be (round).
- **Different types of hand wheel**
As standard the Seguro hand wheel is of cast iron, but steel tube hand wheel can be delivered on request. Valves with reduction gear can be delivered with the manufactures standard hand wheel on request.
- **Special materials**
As we manufacture each valve to order we have wide possibilities to use your choice of materials for e.g.:
 - Bolts, standard is hot galvanised external and AISI 304 internal.
 - Stem, standard is AISI 420.
 - Stem nut, standard is brass.
- **Special face to face length**
Our standard face to face length can be seen on the dimension drawings in this catalogue.
- **Special flanges or combinations**
In some cases, valves with two different flanges such as flat face and mechanical joint are required. Please contact us to see the possibilities.
- **Special stem or actuator flange**
The stem and top are basically in two types, either an operating square and a slim bonnet top, or a round stem with a key and a standard flange according to suit the ISO 5211. We have chosen adequate sizes, but if you would like to fit an actuator with another flange, or you need a special flange e.g. for an extended stem, please let us know.
- **Special paint**
As an alternative to our standard paint, we can coat the valves with other systems and colours as well, please let us know of your needs, and we will find a solution to match.

Special services

In addition to the special designs mentioned above, we are also capable of other services related to the manufacture of the Seguro valves.

- **Fitting actuators**
In our program we have a number of different brands and types of actuators, but if you prefer to supply the actuator yourself, we can mount the actuator for you. We that at our workshop, and test the entire system before shipment to your stock or direct to the site.
- **Special tests**
 - Material certificates
 - Special pressure tests
 - Special torque measurements.
- **Packaging**
Please let us know if the transport or storing method requires special packaging of the valve.

After sales service

Nothing lasts forever. We can off course supply you with spare parts for most previously delivered valves.
